                                                                                                                                                                                                                                                                                                            AAH42709-72 represent promoter elements or transcription binding sites.
                                                                                                                                                                                                                                                                                                                                                                   biology, particularly in requiating gene expression in plants. The
promoters are especially useful for transforming plants or plant cells,
e.g. to increase resistance against insects or herbicides.

                                                                                                                                                                                                                                                                                                        The sequence represents a plant root-proterred promoter element, RPE, isolated from a random oligonucleotide library (ROL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5' and 3' flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to contract specific promoters from plants, including but not limited to contract specific promoters or root-preferred promoter elements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RPES are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. absorbs stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fundi, bacteria,
                                                                                                                                                                                                 Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Root-preferred promoter element: RPE; abiotic stress: drought; salinity; pesticide resistance: biotic stress: disease resistance; tungal disease; bacterial disease; viral disease; insert affack; nematode attack; RPEB; random oliqonucleotide library;

The sequence represents a plant root preferred promoter element, RPE, isolated from a random oligonucleotide library (Rol). The invention concerns a method of identifying and isolating tissue preferred promoter elements comprising the use of a mixture of random oligonacteotides,
                                                                                                                                                                                                                                               Producing Lissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating Lissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RPEs are useful in the genetic manipulation of a plant when operably
linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                          flanked by 5' and 3' flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             tissue-specific promoters from plants, including but not limited to
root-specific promoters or root-preferred promoter elements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Root-preferred promoter element; RPE; abiotic stress; drought; salinity; pesticide resistance; horbicide resistance; biotic stress; disease resistance; tungal disease; barterial disease; viral disease; insert attack; nematode altack; RPE/3; random oligonucleotide library;

The sequence represents a plant root-preferred promoter clement, RPE, isolated from a random oligonocleotide library (ROL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonocleotides, flanked by 5 and 3' flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCE amplifying the bound oligonocleotide. The method is used for isolating tissue specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The RPEs are useful in the genetic manipulation of a plant when operably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria,
                                                                                                                                                                                                                                                                                                             Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Root-preferred promoter element, RPE; abiotic stress; drought, salinity; pesticide resistance; horbicide resistance; biotic stress; disease resistance; fungal disease; bacterial disease; viral disease; insect attack; nematode attack; RPES9; random oligonucleotide library;

The sequence represents a plant root-preferred promoter element, RPE, isolated from a random oligonuclectide library (RCL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonuclectides, flanked by 5' and 3' flanking sequences, which hybridise to tissuespecific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to troot-specific promoters or root-preferred promoter elements (RPE). The RPES are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                Producing tissue-preferred promoter elements constructs for regularing expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Root-preferred promoter element, RPE: abiotic stless; drought; salinity; pesticide resistance; hertic stress; drought disease: bestieride resistance; fundal disease; bacterial disease; viral disease; insect attack; nematode attack; RPE33; random oligonucleotide library;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              isolated from a random oligomicleotide library (ROL), The invention concerns a method of identifying and isolating Lissue-preferred promoter elements comprising the use of a mixture of random oligomicleotides, flanked by 5' and 3' flanking sequences, which hybridise to Lissue-specific plant nuclear proteins, isolating the complexes and PCR amplitying the bound oligomicleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RPES are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                    Producing Lissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating Lissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Koot-preferred promoter element; RPB; abiotic stress; drought; salinity; pesticide resistance; herbicide resistance; biotic stress; disease resistance; fundal disease; bacterial disease; viral disease; insect attack; nematode attack; RPB73; random oligonucleotide library;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fundi, bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a plant root-preferred promoter element, RPE,

isolated from a random oligonucled(ide library (ROL). The invention concerns a method of identifying and isolating tissue-preferred premoter elements comprising the use of a mixture of random oligonucledides, tlanked by 5' and 3' flanking sequences, which upbridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tissue-specific promoters from plants, including but not limited to rook-specific promoters or root-preferred promoter elements (RHE). The RPFs are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, posticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fundi, bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Root-preferred promoter element, RPE, abiotic stress; drought, salhnity, posticular ersistance, herbicide resistance, biotic stress; disease resistance; fundal disease, bacterial disease, viral disease; insect attack; nematode attack; RPES; random oligonucleotide library;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                          isolated from a random oligonuclectide library (ROI). The Invention Concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonuclectides, flanked by 5' and 3' flanking sequences, which hybridise to tissue specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonuclectide. The method is used for isolating tissue-specific promoters from plants, including but not limited to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       root-specific promoters or root-preferred promoter elements (RPE). The RPES are useful in the genetic manipulation of a plant when operably allohed to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria, viruses, insects and nematodes).
                                                                                                                                                                                                                                                                                                                            Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5° and 3′ flanking sequences, which hybridise to Lissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing Lissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating Lissue-preferred promoter elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        achieve a desired phenotypic effect, e.g. abiotic stress (drought, emperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fund; bacheria,
salinity; pesticide resistance; horbicide resistance; biotic stress; disease resistance; fungal disease; bacterial disease; viral disease; insect attack; nematode attack; RPE2; random oligonucleotide library;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Saps

The sequence represents a plant root-preterred promoter element, RPE, isolated from a random oligonuclectide library (ROL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flamked by 5° and 3′ flamking sequences, which hybridise to tissue specific plant nuclear proteins, isolating the complexes and PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing ilssue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     amplifying the bound oligonucleotide. The method is used for isolating
tissue-specific promoters from plants, including but not limited to
root-specific promoters or root-preferred promoter elements (RPE). The

The sequence represents a PCR primer which binds to the 5' flanking region of a random oligonucleotide library (RGL) construct used to isolate tissue-specific promoter elements. The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5' and 3' tlanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RPEs are useful in the genetic manipulation of a plant when operably
linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           achieve a desired phenotypic effect, e.g. abiotic stress (drought, treperature, salinity, pesticide and horbicide resistance) and blotic stress (disease resistance, resistance to attack by fundi, bactoria, viruses, insects and nematodes).
                                                                               Root-preferred promoter element, RPE, abiotic stress; drought; salinity; pesticide resistance; horbicide resistance; biotic stress; desease resistance; fungal disease; bacterial disease; viral disease; instack; nematode attack; random oligonucleotide library; ROE; n19808; ss; PCK primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gabs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Root-preferred promoter element: RPE; abiotic stress; drought; salinity; pesticide resistance; herbicide resistance; biotic stress;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          root-specific promoters or root-preferred promoter elements (RPE).

The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5' and 3' flanking sequences, which hybridise to lissue-specific plant nuclear proteins, isolating the complexes and PCR amplitying the bound oligonucleotide. The method is used for isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The RPEs are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and horbicide resistance) and bictic
                                                                                                                                                                                                                                                                                                                                                                         Producing Lissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating Lissue-preferred promoter elements
disease resistance, fungal disease, bacterial disease, viral disease, insect attack; nematode attack; random oligonucleotide library; ROL; n19811; ss; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               salinity; pesticide resistance; herbicide resistance; biotic stress; disease resistance; fungal disease; bacterial disease; viral disease; insect attack; nematode attack; random oligonucleotide library;

The sequence represents a PCR primer which binds to the 3' flanking readion of a random oligonucleotide library (ROL) constructused to isolate Lissue-specific promoter elements. The invention concerns a method olidentlying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5' and 3' flanking sequences, which hybridise to tissuespecific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating tissue-specific promoters from plants, including but not limited to reopt-specific promoters or root-preferred promoter clements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RPEs are useful in the genetic manipulation of a plant when operably
linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic

                                                                                                                                                               region of a random oligonucleotide library (ROL) construct used to isolate tissue-specific promoter elements. The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, tlanked by 5' and 3' flanking sequences, which hybridise to Lissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating
                                                                                                                                                                                                                                                                    root-specific promoters or root-preferred promoter elements (RPE). The RPEs are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to
                                                                         Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Root-preferred promoter element, RPE; abiotic stress; drought; stress; posticide resistance; brobloide resistance; biotic stress; dispase resistance; fungal disease; bacterial disease; viral disease; insect attack; nematode attack; RPE29; random oligonucleotide library;
                                                                                                                                                                                                                                                                                                      achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The sequence represents a plant root-preferred promoter element, RFE, isolated from a random oligonureledide library (RGL). The invention concerns a method of identifying and isolating tissue-preferred promote elements comprising the use of a mixture of random oligonucleotides, flanked by S, and S, Tlanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonurleotide. The method is used for isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tissue specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (MPE). The RPEs are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAS08438
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                      The sequence represents a plant root-preferred promoter element, RPE, isolated from a random oligonuclecticd library (ROL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides.
                                                                                                                                                  Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements -
                                                                                                                                                                                                                                                                                                    tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The RPES are useful in the generic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria,
                                                                                                                                                                                                                                                                   flanked by 5' and 3' flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating

The sequence represents a plant root-preferred promoter element, RPE, isolated from a random oligonuclectide library (RUL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonuclectides, flanked by 5' and 3' flanking sequences, which hybridise to tissuespecific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonuclectide. The method is used for isolating tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The RPEs are useful in the genefic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying and isolating tissue-preferred promoter elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Root-preferred promoter element, RPB: abiotic stress; drought; salinity; pesticide resistance; herbicide resistance; disease resistance; fungal disease; viral disease; insect attack; nematode attack; RPE39; random oliqonoleoiide library;

                                                                                         0;
                                                                                                                                                                                                                                                                                                                             isolated from a random oligonucleotide library (RGL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, flanked by 5' and 3' flanking sequences, which hybridise to tissuespecific plant nuclear proteins, isolating the complexes and PCR amplifying the bound oligonucleotide. The method is used for isolating
                                                                                                                                                                                                                                                                                                                                                                                                      tissue-specific promoters from plants, including but not limited to root specific promoters or root-preferred promoter elements (RRE). The REPS are useful in the generic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic effect, e.g. abiotic stress (drough, temperature, salinity, pesticide and herbicide resistance) and biotic stress (disease resistance, resistance to attack by fungi, bacteria,
                                                                                                                                                                                                                                        Producing Lissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identitying and isolating Lissue-preferred promoter elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Koor preferred promoter element, RPE, abiotic stress, drought, salinity, pesticide resistance, herbicide resistance, biotic stress, disease resistance, fingal disease, bacterial disease, viral disease, insect attack; nematode attack; random oligonucleotide library.
                                                                                                                                                                                                                                                                                                                   The sequence represents a plant root-preferred promoter element, RPE,

used to isolate tissue-specific promoter elements. The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oliquouelectides, flanked by 5' and 3' flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCK amplifying the bound oliquouelectide. The method is used for isolating tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a random oligonucleotide library (RoL) construct

                                                                                                                                                                                                                                                                                                                                                                                                                                                            tissue-specific promoters from plants, including but not limited to root-specific promoters or root-preferred promoter elements (RPE). The RPES are useful in the genetic manipulation of a plant when operably linked to a nucleotide sequence whose expression is to be controlled to achieve a desired phenotypic ellect, e.g. abiotic stress (drought, temperature, salinity, pesticide and herbicide resistance) and biotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   isolated from a random oligonucleotide library (ROL). The invention concerns a method of identifying and isolating tissue-preferred promoter elements comprising the use of a mixture of random oligonucleotides, tlanked by 5 and 3′ flanking sequences, which hybridise to tissue-specific plant nuclear proteins, isolating the complexes and PCR amplifying the benefit of the complexes and PCR amplifying the benefit of the complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing tissue-preferred promoter elements constructs for regulating expression of nucleotide sequences in a plant comprises identifying an isolating tissue-preferred promoter elements -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                           essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electron format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      programmes. The antisense nucleic acid sequence is also useful to scree
for homologous nucleic acids which are required for cell proliferation
a wide variety of organisms. The present sequence encodes an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense inhibitors of genes essential to prokaryotic collular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 27; Seq ID No 7489; 511pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides (11), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (1) and (11) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (1) may be used to produce the secondary of them which are used to production of vectors containing them which are used to produce hosts coils which express the polypeptides. The polypeptides (11) (and/or nucleic acids) may then be polypeptides. The polypeptides (11) (and/or nucleic acids) may then be
AAH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides (II), given in AAGB1454 to AAGB3120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are in the exemplification of the present invention.
                                                                                                                                                                          Nucleic acids encoding polypeptides from Staphylococcus epidermidis useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO200134809
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Staphylococcus epidermidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Staphylococcus epidermidis SR1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S. epidermidis genomic polynucleotide sequence SEQ ID NO:3336

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SFQ ID NO:4465 to 4472.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        used to vaccinate subjects and to raise antibodies against the bacteria

                                                                                                      (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.
(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the s. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodics against the bacteria used to vaccinate subjects and to raise antibodics against the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptides. The polypeptides (ii) (and/or nucleic acids) may then be used to vaccinate subjects and to raise anthodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA
AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAH5509B represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                        sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                              useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila melanogaster expressed polynucleotide SEQ ID NO 10670
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2617
                                                                                                                 Sequence 7345 BP;
                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 10670; 21pp + Sequence Listing; English

The enzyme is used in the product of gelled loods, gelled cosmetic yoqurt, gelatin, cheese etc. It is also used in the product of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given allows the product HTG efficiently and in large quantity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        qp. of glutamine. It introduces intra- or intermolecular formation
of epsilon (gamma-Gln)-Lys cross-linking when an epsilon-amino gp.
of a Lys residue acts as an acyl receptor. When water acts as an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        given in AAQ24202 to amplify a portion of the BTG gene using PCR techniques. The portion of the gene amplified contained the signal, pro and structural sequences from BTG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic
                                                                                                                                                                                                                                                                                     PCR primer #2 used to isolate Zea mays 700266438 clone promoter cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protects beta-urogastrone and beta-lactamase collects in the periplasm of E.coli. It is therefore easy to collect and purify the product.

Nota-urogastrone is the hormone of the salivary glands which supresses stomach acid secretion and promotes cell growth, so is useful for treating ulcers and wounds. Previously the product was obtd. only
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   easily recovered from the fusion protein expressed by transformants. The fusion protein is less easily degraded by proteases and so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             drid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
The specification describes an Escherichia coli regulatory region modulated by a cellular insult. The regulatory region is preferably sultometuron methyl (SM) responsive regulatory region, preferably bound by the sequences given in AAF55139-40. The recombinant E. coli

It is therefore easy to collect and purify the product. Beta-urogastrone is the hormone of the salivary glands which supresses stomach acid secretion and promotes cell growth, so is useful for treating ulcers and wounds. Previously the product was obtd. only

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The fusion protein is less easily degraded by proteases and so protects beta-urogastrone and beta-lactamase collects in the periplasm of E.coli. It is therefore casy to collect and purify the product. Beta-urogastrone is the hormone of the salivary glands which supresses stomach acid secretion and promotes cell growth, so is useful for treating ulcers and wounds. Previously the product was obtd. only in small ants. from human urine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54576 ro AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-MAY-1998;

                                         colitis;
(d) wound
                                                                                  The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative disease, multiple sclerosis, rheumatoid arthritis and ulcerative
                                                                                                                                                                                                                                             The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification
                                                                                                                                                                                                                                                                                                                                                                                                        cancers and metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-NOV-2000;
